## *Theirs*

- Counterbored
- Case Hardened

## *Ours*

- No Counterbore

Full bearing surface supports the tool for the entire length of bushing. You'll drill more **precise** holes plus your Acme bushing will last **longer**.

- Hardened

$61-65 R_C$  means less machine downtime to change worn bushings.

Acme maintains the highest standards for just about every kind of bushing you'd ever need, including tap holder and tool holder bushings, boring bar sleeves, gun drill bushings, liners and more.

# SELECTION TIPS

## "The best bushing for the job – at the right price, right now."

You can be sure with ACME that you're buying the best bushing for the job. Bushings and accessories have been the backbone of our business since 1914. Our nationwide network of industrial distributors further assures you of prompt personal service.

The following summaries of typical uses for bushings and liners prefaces our simplified, easy to use catalog – the most complete in the industry.

You may find it helpful first to define your specific needs, and then select a compatible bushing. Standard, off-the-shelf drill bushings are the least expensive. Sometimes, though you may require a special order. Acme will be glad to help you with your toughest requirements.

If you have any questions or need assistance, please call our customer service department at : (847) 428-3911 or (800) 323-5582. Our qualified staff of customer service representatives will be happy to assist you or provide you with the name of the ACME distributor nearest you.

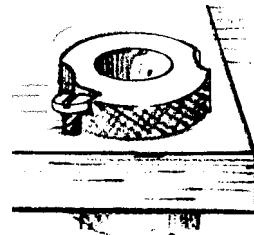

## Things to consider in selecting the PROPER drill bushing.

- Use - To drill, tap or ream?
- Kind - Headless, Head, Slip-Fixed Renewable?
- Production Run - Tungsten Carbide or Titanium Nitride Coated bushings, even at a slightly higher cost than standard steel, will last longer during long production runs.
- Size - Hole size, O.D. size, and length.
- Special Requirements - Threaded O.D., angles, flats on head, other special dimensions.
- Standard or Special - Standard sizes are less expensive. Is a special bushing really necessary or will a standard fill your requirement?

### No-Counterbore Bushings are Standard with ACME

Acme is committed to the concept of manufacturing our bushings without a counterbore. We believe this produces a better, longer lasting and more versatile bushing (especially if you require modified or special bushings). Even though No-Counterbore bushings are more difficult and costly to produce, because close tolerances are required the full length of the bushing, **No-Counterbore Bushings Are Standard With ACME!** Counterbored bushings will be supplied only upon special request.

### Slip-Fixed Renewable Bushings

#### ANSI/ACME Designation Type SF

- The "Two-in-One" Bushing: Fixed mode and slip position options on one knurled head! – flexibility lowers your inventory costs
- Knurled head for easier handling – just turn and lift!
- Used with liner, permanently pressed into drill jig
- Fixed mode for runs longer than life of bushing. Held in place by lock screw or clamp which fits a milled recess in the head.
- Slip mode for multiple operations on the same holes (such as drilling followed by reaming) – without disturbing the workpiece.
- O.D. has a slip fit tolerance for easy insertion or removal from the liner

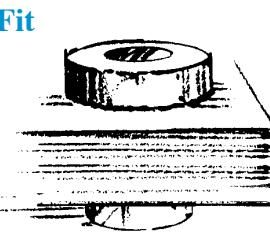

### Headless Press Fit Bushings

#### ANSI/ACME Designation Type P

- Most popular, therefore, least expensive
- Typically for single stage drilling operations
- Permits close spacing
- Mounts flush with top of jig plate
- Available with finish ground O.D. or unground for custom grinding

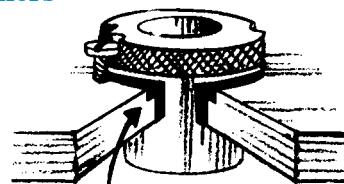

### Head Press Fit Bushings

#### ANSI/ACME Designation Type H

- Same as Headless Press Fit but with head (or shoulder) on the drill entry end
- Head prevents heavy axial loads from forcing bushing through jig hole
- Available with finish ground O.D. or unground for custom grinding
- Flush mounting is possible by counterboring jig hole to fit bushing head

### Headless Press Fit Liners

#### ANSI/ACME Designation Type L

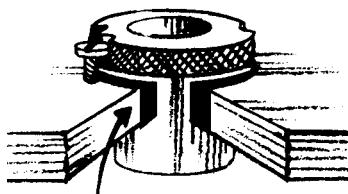

- Used with Slip-Fixed Renewable bushings to provide precise location point
- Permits interchange of Type SF bushings with varied I.D.'s – without affecting centerline accuracy
- Permanently pressed into jig plate – for life of the jig

# SELECTION TIPS

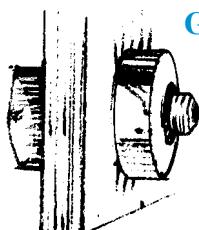

- Protects jig plate hole from wear caused by frequent bushing replacement
- Used where little impact will occur on the SF bushing's head

## Head Press Fit Liners

### ANSI/ACME Designation Type HL

- Similar to Headless Press Fit Liners but with head or shoulder
- Use with Slip-Fixed Renewable bushings whenever excessive pounding will occur during operation
- Head prevents liner from being pushed through jig
- Flush mount by counterboring top of hole in jig plate
- Available with finish ground O.D. or unground for custom grinding

## Gun Drill Bushings

### ACME Designation Type GD

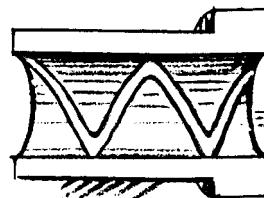

Gun drills are used where maximum precision for long, deep holes is essential.

- Types GDB and GDX are single piece construction
- The other type of Gun Drill bushing is two piece construction. It consists of a Liner (GDL) and an Insert (GDI). The Insert can be removed from the Liner thus allowing for a range of I.D. sizes using the same Liner
- Acme can manufacture special Gun Drill bushings to fit your exact requirements

## Oil Groove Bushings

### ACME Designation Type OG

- Used for drill lubrication or as a bearing
- Lubricant (or coolant) flows through grooves in bushing I.D. wall
- 25 Oil Groove styles available – headless or with heads
- Wiper designs available to help guard against dirt or chips
- NOTE: The oil groove should not break out the wiper end of the bushing

## Extended Range Bushings and Liners

- Sizes larger than ANSI or ACME standards
- Available in types P, H, SF, L and HL
- Unground O.D.'s available for custom grinding

## Extra-Thinwall Bushings

- Reduced wall thickness and head diameters save space
- As durable as regular wall thickness bushings
- For use where extremely close hole patterns must be accurately drilled
- Available in Type P, H, and SF
- Note: This type of bushing will not necessarily be round in the free state

## Embedment Bushings

- Designed specifically for use in soft materials such as aluminum or magnesium
- Can also be used in jigs or fixtures made with laminated fiberglass or castable potting compounds
- Three types available: Diamond Groove, Ser-Groove, and Spline-Lock

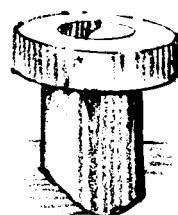

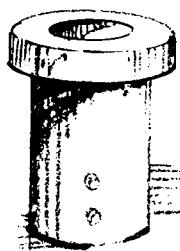

## Tungsten Carbide Bushings

- Extremely Hard – hardness of 78-80 RC
- Can last up to 50 times longer than conventional steel bushings
- Available in Type CP, CH, and CSF

## Titanium Nitride (TiN) Coated Bushings

- Can last up to 40 times longer than conventional steel bushings
- Excellent results where long wearing capabilities are needed but carbide may be too brittle
- Much more cost effective than carbide bushings when larger quantities (can be as low as three pieces depending on size) are involved

## Special/Custom Bushings

## Special Bushings

- Modified Standard - an ANSI/ACME standard bushing is modified or altered in I.D., O.D. or length
- Custom Bushing - Those bushings that can not be easily modified. Requirements can include special diameters, shapes, angles, materials, threads, etc.

## Tool Holder Bushings

- Used to adapt various tools to tool holders or turret bores on many types of machine tools
- Available in five different styles and a complete range of sizes
- Special sizes and configurations can be manufactured to meet your exact requirements

# INSTALLATION TIPS

## Bushing/Liner Installation Tips

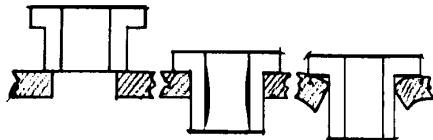

(cast iron or unhardened steel jig plates)

Production accuracy requires extra care when preparing mounting holes and installing bushings/liners. The following factors should be considered: diametral interference fits, alignment, chip clearance, and how close the bushing is to the workpiece.

Because of the many variables, no definite rules can substitute for the skill and judgment of the experienced toolmaker. The following suggestions should be helpful to others.

### Interference Fits

Interference holds press fit bushings in place on the jig plate. Too much interference may cause a number of problems: (1) jig plate distortion; (2) bellmouthing (bushing/liner walls bow inward); (3) tool seizure, or (4) trouble with slip-fixed renewable fitting into the liner.

Too little interference may allow slippage, thus causing inaccurately drilled holes. In most cases, interference of 0.0005 to 0.0008 inch is sufficient to properly install press fit bushings and liners.

### Mounting Hole Roundness

It is recommended that all mounting holes be jig bored or ground to assure roundness. Ordinary twist drills seldom produce an accurately sized or truly round hole!

### Bushing/Liner Installation

First, lubricate the inside diameter of the mounting hole and the outside diameter of the bushing/liner – before pressing into place! Lubrication prevents scoring of the hole wall. White lead is a typical lubricant.

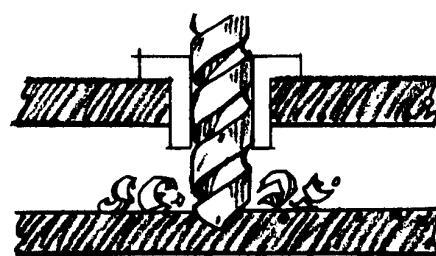

Second, use an arbor press to press the bushing/liner into place. If an arbor press is not available, draw the bushing/liner into place by tightening two steel plates connected by a nut and bolt. A bushing/liner should never be hammered into place! Why defeat the main purpose of the bushing? – Accuracy!

### Chip Clearance

One school of thought suggests a space between the workpiece and the drill bushing. The other suggests direct contact. In order to decide, you should consider the abrasiveness of the material being drilled, the drill size, and the type of bushing/liner being applied.

Chips produced from drilling will be ejected either through a space or through the bushing. If your drill clogs or heats up, try increasing the space between the end of the bushing and the workpiece. Normal spaces vary from one-half the drill diameter for small chips (as from cast iron) to one and one-half times the drill diameter for long stringy chips (as from cold-rolled steel).

Vary the length of Slip-Fixed Renewable bushings to achieve proper spacing for your operation (see number 4 below for a more detailed explanation). A rule of thumb is, the greater the space between the bushing and the workpiece, the greater the chance for error. Where possible, test your conditions and continue to check for accuracy throughout your production run.

### Hints for More Accurate Production and Longer Bushing Life

#### 1) Align Bushings Properly.

Carefully align the drill with the bushing axis to avoid poor alignment and excessive wear. The radius on the bushing will help center the drill point. ACME No-Counterbore bushings help the operator accomplish this with ease.

#### 2) Keep Tools Sharp.

Dull drill bits defeat the precision of bushings. Sharpen by first grinding each drill with the point in the exact center. This helps avoid “walking” by the drill when it first enters the workpiece.

#### 3) Use Proper Coolants.

Check the coolant label to be sure you are using the right coolant for your machining process.

#### 4) Use Slip-Fixed Renewable Bushings for Multiple Operations.

Slip-Fixed Renewable Bushings of different lengths provide for both accuracy and chip removal during multiple operations. For example, a short bushing during drilling will provide the proper clearance for chips to escape. A longer bushing during reaming will provide maximum guidance.

#### 5) Adapt Bushings To Irregular Work Surfaces.

The exit end of the bushing should conform to contours of the workpiece. For maximum guidance, hold to a minimum any space for chip clearance. A drill point that does not enter exactly perpendicular to the work surface will skip or wander. In such a case, side load exerted by the drill is concentrated near the exit end of the bushing. The bushing can wear prematurely. Slip-Fixed Renewable bushings could simplify replacement of worn bushings, and also aid alignment with the contoured work surface. For short production runs using press fit bushings, form the bushing end to the workpiece contour.

#### 6) For Long Production Runs, Use Tungsten Carbide or Titanium Nitride Coated Bushings.

ACME Carbide bushings last up to 50 times longer than hardened steel. ACME Titanium Nitride (TiN) coated bushings can last up to 40 times longer than conventional bushings. Both types of bushings could save valuable replacement downtime. The additional cost is small when you consider the extra long life possible. Call us for more details.

# SPECIFICATIONS

## Bushing Specifications

### ANSI/ACME Standard Drill Bushings:

I.D. Range (Std. Drill Size)	Standard I.D. Tolerance (add to nominal I.D.)
#80 to 1/4	+.0001 to +.0004
Over 1/4 to 3/4	+.0001 to +.0005
Over 3/4 to 1-1/2	+.0002 to +.0006
Over 1-1/2 to 2-3/4	+.0003 to +.0007

### Reamer Bushings:

I.D. Range (Std. Reamer Size)	I.D. Tolerance (add to nominal I.D.)
Up to 1/4	+.0005 to +.0008
Over 1/4 to 1"	+.0006 to +.0010
Over 1"	+.0008 to +.0012

- Finish Ground bushings, 1/8" to 1" I.D., are held within .0003" concentricity T.I.R. (Total Indicator Reading). Other sizes are held within .0005" T.I.R.
- Unground bushings with .010/.020 grinding stock on the O.D. are concentric within .006". The letter "U" as a suffix to the ANSI symbol indicates an unground O.D. for custom grinding.
- Lengths longer than ANSI Standard or relieved bushings will meet the above tolerances at the drill exit end only.

- Standard and Special bushings will be manufactured from thru-hardened tool steel and heat treated to 61-65 RC unless instructed otherwise by the customer.
- No-Counterbore bushings will be supplied unless requested otherwise. No-Counterbore bushings allow for truer alignment, more accurate holes, less tool wear, and less problems with chips packing up in the I.D. of the bushing. Acme will, however, supply counterbored bushings when requested.
- Specifications for Metric Bushings are in the Standard Metric Bushing Section of this catalog.

## Ordering Information

26 pcs.	3/4	P	64	12
<b>Quantity</b>	<b>Inside Diameter</b>	<b>Type</b>	<b>Outside Diameter</b>	<b>Length</b>
For standard drill sizes show: Fraction, Number, or Letter. For Special I.D.'s indicate decimal size to four places.		Type of Bushing: P = Headless Press Fit H = Head Press Fit SF = Slip-Fixed Renewable L = Headless Liners HL = Head Liners	O.D. in 64ths of 1" (ie. "64" = 1")	Length in 16ths of 1" (ie. "12" = 3/4")
		"C" prefix = Tungsten Carbide		"U" suffix = Unground O.D. for custom grinding

### Specify in sequence for each order:

1. Quantity
2. Inside Diameter (Column A in catalog)
3. Type: See Chart above for ANSI/ACME designations
4. Outside Diameter (Column B in catalog)
5. Length (Column C in catalog)
6. Unground O.D.'s specify the Letter "U" after the ANSI Symbol

### • Gun Drill Bushings

Specify I.D., Description or Part number (when indicated) and quantity.

### • Oil Groove Bushings

Specify in sequence: ACME Oil Groove style, Type of Bushing, I.D., O.D., and length (or ANSI Symbol) and material (steel or bronze). Also indicate style of wiper if required.

### • Embedment Bushings

Specify Quantity, I.D. size and ordering symbol.

### • Carbide Bushings

Specify Quantity, I.D. and ANSI Symbol prefixed by the letter "C".

### • Tool Holder Bushings

Order by Acme Part Number and quantity.

# ANSI and Acme Standard Bushings

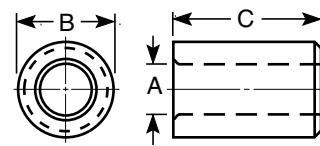

## Headless Press Fit

### Type P

All press fit bushings are lapped, honed or ground in the I.D. Bushings with I.D.'s of 1/8" to 1" are concentric within .0003" T.I.R. to the O.D. Other I.D. sizes are held within .0005" T.I.R.  
No-Counterbore bushings are standard with Acme.

# ANSI and Acme Standard Bushings

## Slip-Fixed Renewable

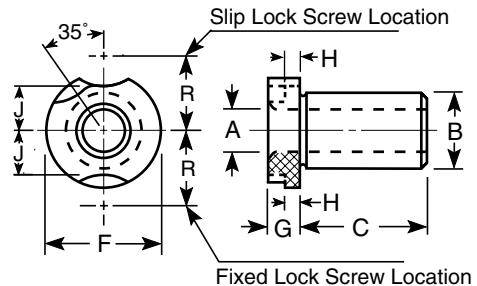

### Type SF

All type "SF" bushings are lapped, honed or ground in the I.D. Bushings with I.D.'s of 1/8" to 1" are concentric within .0003" T.I.R. to the O.D. Other I.D. sizes are held within .0005" T.I.R. A slip fit clearance is provided for proper alignment when inserted into a liner.

No-Counterbore bushings are standard with Acme.

## Headless Liners

All liner bushings are honed or ground in the I.D. Liners with I.D.'s 3/16" to 1" are concentric within .0003" T.I.R. to the O.D. Other I.D. sizes are held within .0005" T.I.R. All unground bushings are left rough on the O.D. with concentricity of approximately .006" T.I.R.

# Extended Range Bushings

## Headless Press Fit

Extended Range Bushings with a ground O.D. are concentric within .0005" T.I.R. Unground Extended Range Bushings have a concentricity of .006" T.I.R. To order an unground O.D., add the letter "U" to the end of the ANSI designation.

Extended Range Bushings are not returnable.

# Extended Range Bushings

## Head Liners

Extended Range Bushings with a ground O.D. are concentric within .0005" T.I.R. Unground Extended Range Bushings have a concentricity of .006" T.I.R. To order an unground O.D., add the letter "U" to the end of the ANSI designation.

Extended Range Bushings are not returnable.

# Extra-Thinwall Bushings

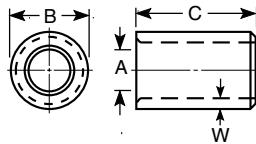

## Type XTW

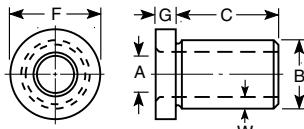

All "XTW" bushings are lapped, honed or ground in the I.D. Bushings with I.D.'s of 1/8" to 1" are ground to give a uniform wall thickness within .0003" T.I.R. Other I.D. sizes are held within .0005" T.I.R. Wall thickness (W) must fall within the range indicated in the chart below to be considered "XTW".

Because of the extremely thin wall, this type bushing tends to assume the shape of the hole into which it is inserted or the shape of the arbor onto which it is pressed. It will not necessarily be round in the free state.

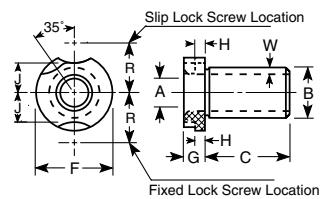

### Type XTWP

### Type XTHW

### Type XTWSF

Unless specified otherwise, "Xtra-Thinwall" Bushings will be manufactured to the following tolerances:

I.D. - Standard I.D. tolerances

O.D. - Type XTWP and XTHW: Standard press fit tolerances

Type XTWSF: Standard slip-fit tolerances

Xtra-Thinwall Bushings are not returnable.

Prices on request.

# Embedment Bushings

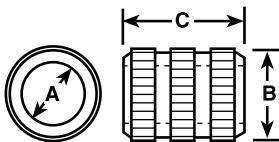

## For Use In Soft Materials

### Type DG

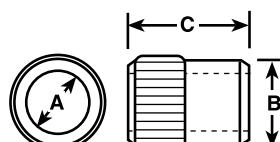

The Diamond-Groove type (DG) has a special knurl that provides superior holding strength in potting compounds and castable materials. The number of grooves is dependent on the length of the bushing.

### Type SG

The Ser-Groove (SG) bushing consists of a serration that permits the bushing to be pressed into a jig or fixture made of soft material or laminated fiberglass while maintaining its holding strength.

### Type SL

The Spline-Lock (SL) type bushing features a partially serrated and partially ground outside diameter. This configuration enables the bushing to be pressed into soft metals or wood.

## ACME ULTIMATE™ BUSHINGS

- Is the brittle nature of Carbide Bushings unacceptable for your application?
  - Does the quantity of bushings you require for a job make Carbide Bushings cost prohibitive?
  - Is the abrasive action of Carbide Bushings causing premature tool wear?
- Acme Ultimate Bushings are the answer!

Acme Ultimate bushings are Titanium Nitride (TiN) coated for longer life. Titanium Nitride coated bushings have a hardness of 82-85 RC. This increase in surface hardness means the bushings can stand the abrasive wear of tools and chips for much longer periods of time and are less brittle than carbide bushings.

The TiN coating on Acme Ultimate Bushings has a very slippery surface. This slippery surface on the I.D. of the bushing will help increase tool life.

The greater the number of bushings needed for an application, the more Acme Ultimate Bushings can reduce your cost.

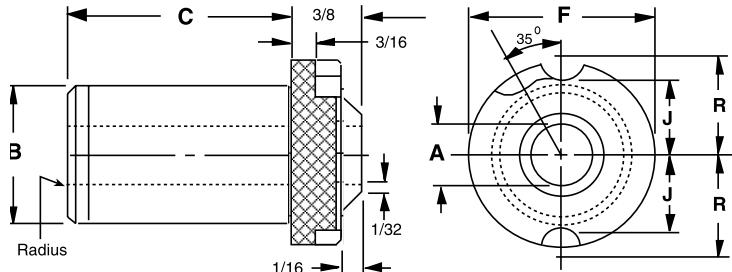

Contact us for more information.

# GUN DRILL BUSHINGS

## Type GDB

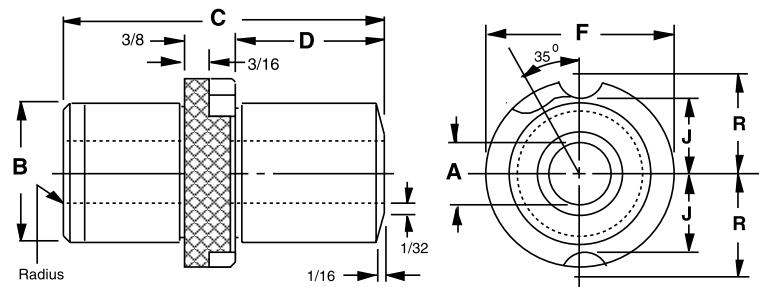

Acme Type GDB Bushings are thru-hardened to 61–65 RC and ground concentric within .0002" T.I.R. The head is undercut and ground square to the outside diameter. The face is square to the inside diameter within .0002" T.I.R. Type GDB Bushings are manufactured from semi-finished inventory for quick delivery.

Description	A I.D. Range +.0002 / -.0000	B O.D. Size		C Length (Under Head)	Head Dimensions			Lockscrew
		Nominal	Actual		F	J	R	
GDB-64-16	3/16 – 25/32 (.1875) (.7812)	1"	1.0000 .9998	1"	1-27/64	19/32	59/64	2A-LS

GDB-88-22	1/4 – 1-1/16 (.2500) (1.0625)			1-3/8				

## Type GDX

Type GDX Bushings are made to the same high standards as Acme's other Gun Drill Bushings. The I.D. is ground concentric to the O.D. within .0002" T.I.R. and the face is also square to the I.D. within .0002" T.I.R. The head is undercut and ground square to the O.D. The O.D. of length "D" is left unground. GDX Bushings are made from tool steel and thru-hardened to 61–65 RC. Special sizes and materials are available on request.

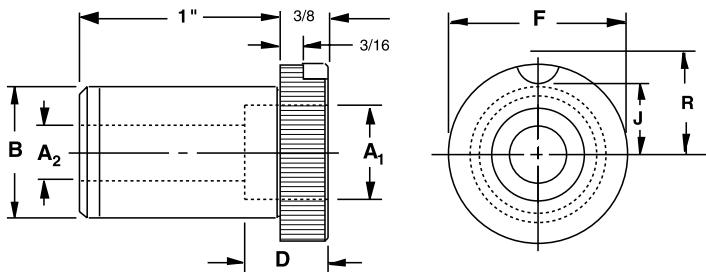

Description	A I.D. Range +.0002 / -.0000	B O.D. Size		C Overall Length	D	Head Dimensions			Lockscrew

GDX-88-54	5/16 – 1-1/16 (.3125) (1.0625)			3-3/8	2"				

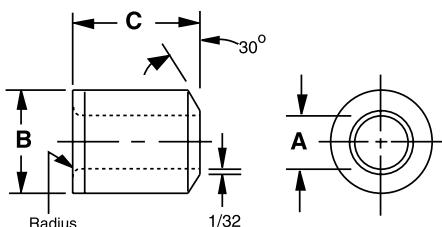

# GUN DRILL BUSHINGS

## Liners – Type GDL

Acme Gun Drill Liners are designed to be used with the replaceable inserts indicated in the table below. All type GDL Bushings are ground concentric within .0002" T.I.R. The heads are undercut and ground square with outside diameters so the liner will seat flat against the chip box.

Part Number	Description	A <sub>1</sub> +.0002 -.0000	A <sub>2</sub> ±.005	B O.D. Size		D	Head Dimensions			Lockscrew	Insert Used

Acme Gun Drill Inserts are manufactured from thru-hardened tool steel and heat treated to 61–65 RC for longer life. The I.D., O.D., and face of GDI Bushings are ground concentric and square within .0002" T.I.R.

Inserts are stocked in standard drill sizes only. Special I.D. sizes and special materials (ie. Carbide or Titanium Nitride coating) are available to meet your requirements.

# Special / Custom Drill Bushings

## To Standardize is to Economize

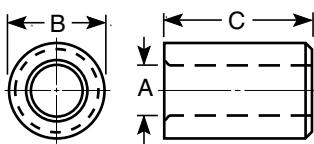

— Always try to order a standard bushing

Where possible, ACME will modify ANSI/ACME standard bushings to meet your requirements. This will save you money. However, we will gladly manufacture to your specifications and tolerances.

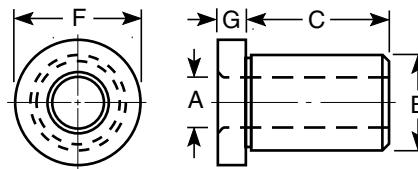

Just photocopy this page, fill in the necessary information and mail or FAX to:

ACME INDUSTRIAL COMPANY  
441 Maple Avenue  
Carpentersville, IL 60110  
Attn: Customer Service Department

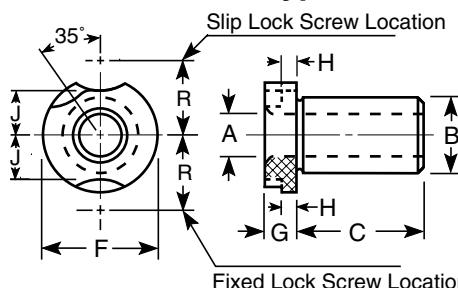

### Headless Press Fit – Type P and Headless Liner – Type L

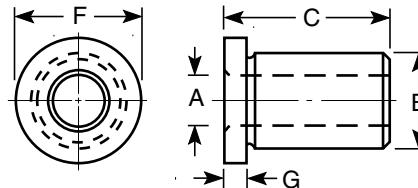

### Head Press Fit – Type H

### Slip-Fixed Renewable – Type SF

### Head Liner – Type HL

Please Fill in the Required Dimensions:

A (I.D.)	B (O.D.)	C (Length)	F (Head Diam.)	G (Head Thick.)

Please check the type of bushing desired:

- P = Headless Press Fit
- H = Head Press Fit
- SF = Slip-Fixed Renewable
- L = Headless Liners
- HL = Head Liners

Additional Information:

Acme CNC Tool Holder Bushings are designed to adapt tools such as drills and boring bars to NC or CNC machine tools. The elongated slots on the body make adapting tools to all brands of equipment a snap. Set screws in the head of these bushings permit use with preset tooling. Type Z bushings are hardened and ground for long life and precision alignment.

Type B Tool Holder Bushings are split through the entire length of the bushing on one side. This enables the bushing to clamp on the shank of cutting tools by tightening the screws in the turret bore or tool holder. Acme Type B bushings are hardened and precision ground to provide a longer lasting more accurate bushing. Solid, soft blanks with a machine finish are available upon request.

# TOOL HOLDER BUSHINGS

## Solid Style Type J

Acme Type J Tool Holder Bushings have clearance holes for set screws for proper clamping on the shank of tools. These bushings are hardened and ground for long life and accurate alignment. Solid, soft blanks for custom machining are available on request.

Acme Boring Bar Sleeves are ideal for adapting boring bars and other shank type tools to machine turret bores or tool holders. The long lengths and sturdy construction provide extra support to extend the range of the tool. These sleeves are hardened and ground. Special sizes can be manufactured to your specifications.

# Standard Metric Bushings

## Technical Information

### No-Counterbore Bushings are Standard with ACME

Acme is committed to the concept of manufacturing our bushings without a counterbore. No-Counterbore bushings are more difficult and costly to produce, because close tolerances are required the full length of the bushing. We believe this produces a better, longer lasting and more versatile bushing. Counterbored bushings will be supplied only upon special request.

### Plain Press Fit Bushings - Type PM

- Least expensive
- Typically for single stage drilling operations
- Permits close spacing
- Mounts flush with top of jig plate
- Length is measured overall

### Head Press Fit Bushings - Type HM

- Same as Plain Press Fit but with head (or shoulder) on the drill entry end
- Head prevents heavy axial loads from forcing bushing through jig hole
- Flush mount by counterboring top of hole in jig plate
- Length is measured overall

### Slip-Fixed Renewable Bushings - Type SFM

- Fixed and removable options on one knurled head for easier use
- Used with liner, permanently pressed into jig
- Held in place by lock screw or clamp which fits a milled recess in the head
- Fixed mode for runs longer than life of bushing
- Slip mode for multiple operations on the same holes (such as drilling followed by reaming)
- O.D. has a slip fit tolerance for easy insertion or removal from the liner
- Length is measured under the head

### Plain Liners - Type PM

- Used with Slip-Fixed Renewable bushings to provide precise location point
- Permits interchange of Type SFM bushings with varied I.D.'s – without affecting centerline accuracy
- Permanently pressed into jig plate – for life of the jig
- Protects jig plate hole from wear caused by frequent bushing replacement
- Used where little impact or force will occur on the SF bushing's head
- Plain Liners are the same as Plain Press Fit Bushings

### Head Liners - Type HM

- Similar to Plain Liners but with a head or shoulder
- Use with Slip-Fixed Renewable bushings whenever excessive pounding or force will occur during operation
- Head prevents liner from being pushed through jig plate
- Flush mount by counterboring top of hole in jig plate
- Length is measured overall
- Head Liners are the same as Head Press Fit Bushings

### Bushing Installation

Production accuracy requires extra care when preparing mounting holes and installing bushings/liners. The following factors should be considered: interference fits, alignment, chip clearance, and how close the bushing is to the workpiece.

Because of the many variables, no definite rules can substitute for the skill and judgment of the experienced toolmaker.

### Interference Fits

Interference holds press fit bushings in the jig plate. Too much interference may cause a number of problems: (1) jig plate distortion; (2) bellmouthing (bushing/liner walls bow inward); (3) tool seizure, or (4) trouble with slip-fixed renewable fitting into the liner. Too little interference may allow slippage, thus causing inaccurately drilled holes.

# Standard Metric Bushings

## Technical Information

### Mounting Hole Preparation

It is recommended that all mounting holes be jig bored or sized with a reamer to assure roundness. Bushings tend to assume the shape of the hole they are pressed into. See chart below for recommended size.

The recommended installation hole size should be in accordance with metric tolerance class H7.

Nominal O.D.	Recommended Hole Size
4 to 6	Nominal +0/-.012
7 to 10	Nominal +0/+.015
12 to 18	Nominal +0/+.018
22 to 30	Nominal +0/+.021
35 to 48	Nominal +0/+.025
55 to 78	Nominal +0/+.030
85 to 115	Nominal +0/+.035
125	Nominal +0/+.040

### Press Fit Bushing Installation

First, lubricate the inside diameter of the mounting hole and the outside diameter of the bushing/liner.

Second, use an arbor press to press the bushing/liner into place. If an arbor press is not available, draw the bushing/liner into place by tightening two steel plates connected by a nut and bolt. Maintain centerline perpendicularity.

### Bushing Features

- All bushings that are ground on the O.D. are held within .012 mm concentricity T.I.R. (Total Indicator Reading).
- Longer lengths than standard or excessively counterbored bushings will meet the above tolerances at the drill exit end only.
- All Acme bushings are manufactured with a blended radius at the drill entrance end unless specified otherwise.
- All Press Fit bushings have a chamfer and ground lead on the exit end.
- Standard and Special bushings will be manufactured from thru-hardened tool steel and heat treated to 61-65 Rockwell "C" unless instructed otherwise by the customer.
- No-Counterbore bushings will be supplied unless requested otherwise. No-Counterbore bushings allow for truer alignment, more accurate holes, less tool wear, and less problems with chips packing up in the I.D. of the bushing.

### Inside Diameter Tolerances

The minimum and maximum allowance for the Inside Diameter of standard bushings is in accordance with metric tolerance class G6. Special bushings will be supplied with the tolerances shown, unless specified otherwise.

Standard Drill Bushings:

I.D. Range (Drill Size)	Standard I.D. Tolerance (add to nominal I.D.)
0.35 to 3.00	.+002 to .+.008
3.01 to 6.00	.+004 to .+.012
6.01 to 10.00	.+005 to .+.014
10.01 to 18.00	.+006 to .+.017
18.01 to 30.00	.+007 to .+.020
30.01 to 50.00	.+009 to .+.025
50.01 to 80.00	.+010 to .+.029
80.01 to 105.00	.+012 to .+.034

Reamer Bushings:

I.D. Range (Reamer Size)	I.D. Tolerance (add to nominal I.D.)
1.00 to 3.00	.+.006 to .+.012
3.01 to 6.00	.+.010 to .+.018
6.01 to 10.00	.+.013 to .+.022
10.01 to 18.00	.+.016 to .+.027
18.01 to 30.00	.+.020 to .+.033

Reamer Bushings are considered specials and are priced accordingly. When ordering specify the letters "RM" after the I.D.

### Outside Diameter Tolerances

The minimum and maximum metric tolerance for the Outside Diameter of standard press fit bushings is class s6 and class h5 for slip-fixed renewable bushings.

### Ordering Information

To order metric bushings please provide the quantity required, ANSI Symbol, and inside diameter. The order for 26 pieces of a 38 mm I.D., by 55 mm O.D., by 30 mm long, Type PM bushing should appear as follows:

Qty. Type O.D. Lgth. I.D.  
(in mm) (in mm) (in mm)  
26 pcs. PM - 55 - 30 - 38.00

# Standard Metric Bushings

## Plain Press Fit

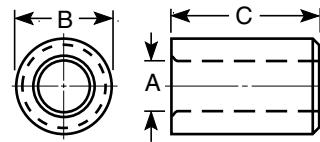

### Type PM

All press fit bushings are lapped, honed or ground in the I.D. and are concentric within .012 T.I.R. to the O.D.

Please order by providing the ANSI symbol and I.D. size. Example: 9mm I.D. X 15mm O.D. X 20mm Long Type PM, order as PM-15-20-9.00

No-Counterbore bushings are standard with Acme.

No-Counterbore (Full Bearing Surface) Bushings are Standard at ACME.

# Standard Metric Bushings

## Head Press Fit

### Type HM

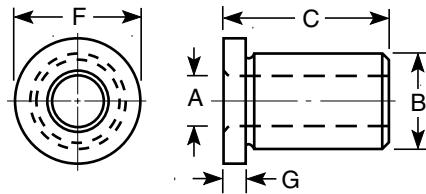

All press fit bushings are lapped, honed or ground in the I.D. and are concentric within .012 T.I.R. to the O.D.

Please order by providing the ANSI symbol and I.D. size. Example: 9mm I.D. X 15mm O.D. X 20mm Long Type HM, order as HM-15-20-9.00

No-Counterbore bushings are standard with Acme.

Please note that the length on type "HM" bushings is measured overall.

No-Counterbore (Full Bearing Surface) Bushings are Standard at ACME.

# Standard Metric Bushings

## Slip-Fixed Renewable

### Type SFM

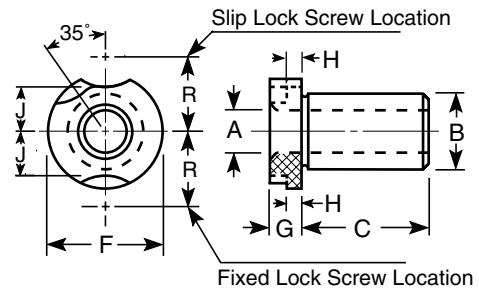

All type "SFM" bushings are lapped, honed or ground in the I.D. and are concentric within .012 T.I.R. to the O.D. A slip fit clearance is provided for proper alignment when inserted into a liner.

Please order by providing the ANSI symbol and I.D. size. Example: 8.5 mm I.D. X 15 mm O.D. X 28 mm Long Type SFM, order as SFM-15-28-8.50

No-Counterbore bushings are standard with Acme.

Please note that the length on type "SFM" bushings is measured under the head.

All dimensions are in millimeters.

No-Counterbore (Full Bearing Surface) Bushings are Standard at ACME.

# Standard Metric Bushings

## Plain Liners

### Type PM

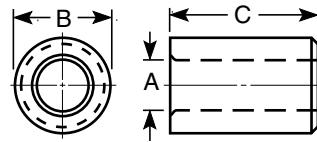

All liners are honed or ground in the I.D. and are concentric within .012 T.I.R. to the O.D.

Please order by providing the ANSI symbol and I.D. size.  
Example: 15mm I.D. X 22mm O.D. X 28mm Long Type PM,  
order as PM-22-28-15.00

No-Counterbore bushings are standard with Acme.

Plain Liners are dimensionally the same as Plain Press Fit Bushings so they both have the same type "PM" designation.  
Some catalogs may refer to Plain Liners as type "LM".

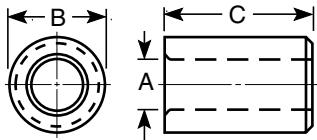

A Inside Diameter (Actual I.D.)	B Outside Diameter (Actual O.D.)	C Length Overall	ANSI Symbol Type "PM"
